International Copper Study Group: Intergovernmental Organization

- Membership open to any country involved in copper production, use or trade.
- Headquarters in Lisbon, Portugal with International Lead, Zinc and Nickel Study Groups
- Countries joining recently: Iran, Mongolia, DR Congo and Brazil.
- 25 ICSG member governments plus the European Union in 2022. 40 countries in 3 Groups.
- Chile is a valued ICSG member country in 2022.

Presentation Contents

- 1. Introduction: Global Copper Demand, Industrial Uses and Value Chain: Recent data**
- 2. Copper Content in Global Copper Concentrate Output and Trade: Recent Data**
- 3. Changes in Arsenic Content in Global Copper Concentrates Output and Exports**
- 4. Changes in Arsenic and Mineral Composition of Copper Concentrates Exported from Chile**
- 5. Impact of More Arsenic in Concentrates And Copper Smelters/Refineries Response**
- 6. Copper Mines and Copper Smelters Capacity Changes Expected in 2021-2030**
- 7. Conclusions**

ICSG

International Copper
Study Group

**1. Introduction: Supply Side
Value Chain, Global Copper
Demand, Industrial Uses:
Recent Data**

Global Copper Flows: The Supply Side in 2021.

SX-EW Mine Refined + Concentrate Refined = 20.7 Mt-Cu

Scrap Refined + Scrap Direct Melt* = 10.4 Mt-Cu in 2021?

Global growth in scrap refined: 3.4 Mt-Cu in 2021 confirmed by Recyclables Survey

More scrap directly melted by fabricators in 2021* to reduce expensive refined use.

Peak global SX-EW output in 2020, 4 Mt-Cu, then contraction in 2021 to 3.9.Mt-Cu.

ICSG world reported fabrication output: +5.2% in 2021 vs 2019.

It did not contract in 2020, due to higher Chinese semis production.

**Copper and Alloys Fabrication Output Reported by ICSG
in Gross Weight, kt**

New generation of fabrication plants, mainly but not only in China, driving 2020-2030 copper demand from mines, scrap, smelters and refineries.

New Copper and Alloys Fabrication Capacity and Projects in China and the ROW in 2016-2021 kt

ICSG Directory of Copper First Use Fabrication Capacity: published every year.

With limited SX-EW, world smelters processed more concentrates with less copper content and used more scrap in 2018-2021.

2018 Global Smelter Supply and Mine Refined

2021 Global Smelter Supply and Mine Refined

**In 2021 China's share of copper refined output from concentrates
~80% of all copper refined in China in 2021.
Refined copper scrap share decreased to <20%.**

China Refined Copper Output 2014 by Source

China Refined Copper Output 2021 by Source

2018-2020: refined copper markets in deficit and sustained by de-stocking.
2021: deeper deficit on demand expansion, driven by fabricators recovery,
+ wealth protection from negative real interest rates. More stocks out of the exchanges.

ICSG Global Balances of Refined Copper kt-Cu

**Russian Federation domestic copper uses increased ~67% in 2021
on a refined export tax, driving semis, mainly wire rod, to over 600 kt per year.**

**Russian Federation Domestic Copper Uses
2020-2021 in kt-Cu**

In 2022 >50% of the exports of refined copper from the Russian Federation in risk of being reallocated.

Refined Copper Imports from the Russian Federation in 2021 kt-Cu

Restrictions to trade of Russian Federation copper products to contribute to tighter supply of copper metals ex-China.

Russian Federation Copper Value Chain in 2021 Preliminary Data in kt-Cu

The energy price shock of 2021-2022: energy supply continues to tighten.

**China "Dual Control System": energy consumption/output rate down:
copper smelters to target higher grade feed producing greater output.**

Now you can get a tonne of refined copper with less than 170 grams of gold.

One tonne of refined copper cost around 1 kg of gold when trade is restricted.

Price of One Tonne of Refined Copper in Grams of Gold. ICSG March 2022

ICSG

International Copper
Study Group

2. Copper Content in Global Copper Concentrate Output and Trade: Recent Data and Future Drivers

**Most abundant low grade porphyry deposits were mined first,
so copper ore grades in output averaging down 2020-2030.**

% of Copper Resources in Mines Operational and Undeveloped

ICSG based on Mudd (2017)

Reduction in copper ore grades and projections: challenging for mining countries due to increasing costs to extract very low-grade ores.

[https://www.researchgate.net/publication/358670677_Chemical_Composition_Data_of_the_Main_Stages_of](https://www.researchgate.net/publication/358670677_Chemical_Composition_Data_of_the_Main_Stages_of_Copper_Production_from_Sulfide_Minerals_in_Chile_A_Review_to_Assist_Circular_Economy_Studies)

[Copper_Production_from_Sulfide_Minerals_in_Chile_A_Review_to_Assist_Circular_Economy_Studies](https://www.researchgate.net/publication/358670677_Chemical_Composition_Data_of_the_Main_Stages_of_Copper_Production_from_Sulfide_Minerals_in_Chile_A_Review_to_Assist_Circular_Economy_Studies)

Most of the copper reserves being developed in 2020-2030 are in copper mines with low or falling copper ore grades.

Copper Ore Grades in Top 25 Copper Mineral Reserves %Cu

Funding, social licenses, permits, water shortages, price volatility, instead of low ore grades limit mine expansions and new projects.

**Current technology to extract low grade reserves means
low grade copper deposits have high chances of being mined
if prices remain attractive.**

Copper Reserves in Top 25 Copper Mines Beyond 2019 Mt Cu

Big expectations on new high ore grade capacity at DRC Kakula, Kansoko, Kakula West and Kamo North projects.

You are here

2022 production guidance for Kamo-a-Kakula in the DRC:
290-340 kt-Cu, low arsenic concentrates to be exported to China.
Output from first two phases projected: >450ktpy by 2023-2024.

Chile copper concentrates oversupply ahead?

Massive Chilean copper concentrate supply growth expected in 2023-2028.

Source: Lagos, G.; Peters, D.; Lima, M.; Jara, J.J.

"Potential copper production through 2035 in Chile". *Mineral Economics* 2020, 33, 43-56.

**After years of constrained concentrate output and exports,
growth in global concentrate supply observed in 2021.**

Global Copper Concentrate Output and Exports
Copper Content kt-Cu

**Copper content in global copper concentrates output:
stagnated around 16.5 Mt-Cu per year in 2017-2020**

but finally >17.2 Mt-Cu in 2021 on China, ROW expansions and Peru recovery.

Copper Content in Global Copper Concentrates Output kt-Cu

Global production of concentrates up in 2021 over 17 Mt-Cu per year for first time: on China, Peru Recovery and ROW supply.

Copper Content in Copper Concentrate Production in kt-Cu

Massive contraction in copper content in global exports of copper concentrates in 2020...followed by record export volumes in 2021.

World Reported Exports of Copper Concentrates in copper content kt-Cu

Share of global exports of concentrates in relation to output stagnated in 2020-2021 due to port restrictions and lockdowns.

World Copper Concentrate Exports/Output Ratio

Still far from peak concentrate exports from Chile and Peru in 2021, Indonesian recovery and advances in non traditional exporters.

Copper Content in Exports of Copper Concentrates by Exporter kt-Cu

Significant annual growth of >4% in global imports of copper concentrates confirmed for 2021, as Chinese, Indian and Korean imports recovered.

**Reported Gross Weight Imports of Copper Concentrates
in kt gross weight, preliminary 2021 data,**

European and Japanese copper concentrate imports in 2021 below 2020, versus China, India and the Korean Republic imports.

Gross Weight Copper Concentrate Imports Growth 2021/2020 by Country kt

Indonesia copper in concentrates exported: strong 2021 recovery.

Around 2025-2026 smelters under construction in Indonesia might process all copper concentrates currently exported.

Indonesia Copper Content in Exports of Copper Concentrates kt

Indonesia developed a successful stainless steel industry, based on foreign investments and Ni concentrate export bans.

Indonesia Nickel and Stainless Steel Production, kt per year

Indonesia President: export controls on unprocessed minerals ahead.

- *"We have always exported our raw material and we must stop it.*
 - *We have discontinued nickel exports. Next year we will stop exporting bauxite.*
 - ***After bauxite, we will stop exporting copper.***
 - *After copper, we will stop exporting tin.*
 - *The nickel case has been brought to the WTO. It is all right, we will face it.*
 - ***If we produce finished goods, it will generate 10 times of added values.***
 - ***If we stop exporting bauxite, exporting copper, exporting tin, exporting gold and other raw material exports, we will get more.***
 - *I fervently believe that if we do this until 2023 and 2024, our gross domestic product (GDP) in 2030*
 - ***will triple".***
- President Joko Widodo
 - at the 7th Anniversary of the Indonesian Solidarity Party
 - January 2022

Mongolian exports of concentrates: stable and high arsenic, but slightly below 0.5% China import limit, so it is “clean”.

Mongolia Copper Concentrates Exports in kt and kt-Cu

Increase in Russian Federation copper concentrate exports 2020-2021:
Tominskoye copper mine start-up in **April 2020** and Bystrinsky mine start-up in **2018**
More exports in 2021 after Kola MMC Monchegorsk smelter stop to control air emissions.

**2021 Imports of Copper Concentrates from
the Russian Federation Reported in Gross
Weight kt**

Russian Federation: record copper concentrate exports in 2020-2021
622.4 kt in 2021, most to Northern China smelters.
Udokan copper mine to be commissioned in 2022 will increase exports.

Russian Federation Exports of Copper Concentrates

International Copper
Study Group

3. ICSG Research Advances on Arsenic in Copper Concentrates Output and Exports

Other minerals in exports of copper concentrates: growing faster than copper contents: data on 180 traded copper concentrates shows an average grade of 27% copper in recent years.

**World Reported Copper and Other Elements Exported as Copper Concentrates
in kt: 2008-2019, 2020 Estimated and 2021 Forecast**

Latest update of global copper concentrates exports: record gross weight export volumes in 2021, slightly more copper content. **High chance of global copper content over reported in recent years.**

World Reported Copper and Other Elements in Copper Concentrate Exports

Smelters in China, Japan and Korean Republic: increasingly depend from blending and complex concentrate exports from Chile and Peru.

**Main Exporters and Destination of Copper Concentrates,
2019 in Gross Weight kt**

**Other minerals in exports of copper concentrates in 2021: 26.6 Mt.
from Chile ~37%, Peru ~22%, Australia 5% and from rest of the world ~35%.**

**Copper and No Copper Content in Main Exporters of Copper Concentrates:
2020 Estimate in Thousand Tonnes Gross Weight kt.**

Important volumes of minor metals contained in global exports of copper concentrates traded internationally in recent years.

**Minor Metals in World Exports of Copper Concentrates:
Estimated Annual Average 2017-2019 in tonnes**

Most of the copper concentrates available in the global market has less than 0.3% Arsenic, still called “clean concentrates”.

**World Copper Concentrate Production by Arsenic Content:
2020 Forecast in Mt, Gross Weight**

**Increasing arsenic content in global output of copper concentrates:
source of environmental regulations and more carefull industry monitoring,
processing, extraction, estabilization and disposal.**

Arsenic Content in Global Copper Concentrate Output %

Mineral composition ranking for global copper concentrate output over 62 Mt-Cu per year estimated with record Arsenic >200 kt in 2021.

Mineral Composition in World Copper Concentrates Output: Changes 2017-2020

Average Estimates Based on Information Collected from Mining Companies and Governments

Units in thousand tonnes kt

	2017	2018	2019	2020 Preliminary

Several large-scale blending facilities commissioned in China in 2021.

Zijin Mining new China concentrate blending facility with Minmetals. Plant in Lianyungang port of Jiangsu province approved in 2021.

In 2019 Glencore started a new copper concentrates blending facility in Taiwan (China).

No new limits to minor metals in concentrates imports in China in 2021.
Permits to process complex concentrates and blending plants in China will keep arsenic flows to Chinese smelters and hazardous waste disposal places in China.

New Limits Proposed in 2019 to Imports of Copper Concentrates to China (% Versus Existing Limits)

**Arsenic in 2016 Global Copper Concentrates Supply
Already Treated (kt-As)**

**Arsenic Distribution in Clean and Complex
Copper Concentrates Already Treated in 2016 (kt-As)**

Half of copper concentrate output complied with China's Arsenic limits.
If the limit was tightened, blenders might not source enough "clean" concentrate.

**Arsenic Volumes in Global Copper Concentrates
Output (kt) by Arsenic Content (% As)**

Air Emission Limits for Chinese Copper Smelters in 2018 (non metal pollutants) in mg/m³

Chinese Copper Smelters % Sulphur Capture Standard in 2018 - Reported by ENFI

**More smelters in China are disposing Arsenic as Scorodite now.
More smelter flue dust to be processed in-house in 2020-2025.**

Stabilization of High Arsenic Flue Dust in a Flash Copper Smelter in China (2016)

Treatment of ESP Flue Dust in LS-Nikko Copper Smelter Korean Republic (%)

**Korean Republic smelter using waste acid to recover bismuth
from flue dust, then residuals are re-circulated.**

European smelters increased capacity to recover by-products and capture hazardous wastes. In 2020-2021 they refocused in copper recycling investments in Europe and in North America. But the scrap supply is limited.

METALLO 
THE FURNACE OF INNOVATION

Arsenic from acid plants flue dust, is now disposed as stable residue thanks to Professor Demopoulos and others. The new challenge is removing Arsenic in mines, concentrators, smelters and mine tailings.

6. Copper Mines, Smelters and Refineries Capacity and Technology Challenges 2022-2030

Global copper mine capacity to produce concentrate: **81% of mine capacity.**

Copper mine capacity >200 kt/year: **46%** of world capacity in 2021.

Capacity by Mine Size

Capacity by Mine Type

Small economies of scale observed in most of copper smelters operational outside China.

Number of Copper Smelters in COPPER 2019 Survey

**Source: 2019 Copper Smelting Survey. COPPER 2019
Vancouver, Canada.**

Outside China, copper smelters have survived on strategic advantages: proximity of mines, arsenic treatment, scrap use or ownership.

● Upstream Integration

- Strategic acquisitions

● Alternative Raw Materials

- Complex concentrates
- Secondary materials

● Geographical Location

- Proximity to mines
- Government policy downstream value
- Government policy emissions

A significant change in copper smelter technology observed in the new generation of copper smelting capacity 2008-2026*.

* See detailed technology information in ICSG
Directory of Copper Mines and Plants
January 2022 Edition.

Flash still the industry standard, but new smelters scales are larger with cleaner high oxygen blowing and all in China.

New bath technologies in concentrate smelters replacing traditional and outdated technologies.

Bath smelting technologies took more smelter market share.

Noranda Reactor/Teniente Converter replaced by **Top Submerged Lance Technology**

Bath Smelting Technologies:

% of Global Output

Massive global copper smelter capacity expansions expected in 2022-2026 on new smelters and expansions in China, Indonesia, Uzbekistan, Iran, Russian Fed., South Africa, United States (scrap), Zambia and Serbia.

Global Copper Smelter Capacity Pipeline 2021-2026, some probability of commissioning: ~3.4 Mt-Cu of new capacity.

Copper Smelter Capacity Expected by Project for 2021-2026 kt-Cu

A second wave of new copper smelter capacity, some already confirmed commissioned around 2026 and beyond might add over 2.03 Mt-Cu more.

Copper Smelters Capacity Additions for 2026+ in kt-Cu

**Increase in copper smelter capacities expected by 2030:
+ 5.2 Mt/year for concentrates and only 310 kt / year for copper scrap.
Global copper mine capacity utilization in 2021: 81%.**

Copper Smelter Capacity Pipeline 2021-2030 by Raw Material

Conclusions

1. New generation of large **copper fabrication plants**, driving 2020-2030 demand from mines and smelters.
2. Industrial use and investment demand for refined copper **recovered strongly in 2021**.
3. Restrictions to international trade of copper in 2022 risk to create **shortages in some regions**.
4. Contraction in copper output and exports of concentrates in 2020 followed by **record volumes in 2021**.
5. New generation of mines producing concentrates in **2022-2030** to increase supply and As volumes.
6. Arsenic and other minor metals in concentrates **spreading** to Asia, Europe, ROW via blending plants.
7. End of Indonesian conc. exports in 2026 versus **+DRC** clean concentrates in 2023, then DRC smelter.
8. Global copper smelter capacity: many in development for 2022-2030 and not only in China.
9. "Impurities" increasing smelter waste treatment costs and **polluting slag use** in Asian infrastructure.
10. CAPEX, water and environmental permits: **main constraints** instead of falling ore grades for miners.
11. New generation of smelter technology capturing impurities making **obsolete** some smelters ex China.
12. Smelters specialized in processing complex concentrates in mining districts versus **+blending plants**.
13. More **pressure on clean concentrates balance** for 2022 that look vs trade disruption risks.
14. Governments and industry to focus on Arsenic capture, stabilization and safe disposal.
15. First in **mines, concentrators**, smelters and refineries. Tailings As management and reprocessing ahead.
